2 CRF-package

CRF-package

CRF - Conditional Random Fields

Description

Library to decode/infer/sample/train Conditional Random Fields

Details

CRF is R package for various computational tasks of conditional random fields as well as other probabilistic undirected graphical models of discrete data with pairwise (and unary) potentials. The decoding/inference/sampling tasks are implemented for general discrete undirected graphical models with pairwise potentials. The training task is less general, focusing on conditional random fields with log-linear potentials and a fixed structure. The code is written entirely in R and C++. The initial version is ported from UGM written by Mark Schmidt.

Decoding: Computing the most likely configuration

- decode.exact Exact decoding for small graphs with brute-force search
- decode . chain Exact decoding for chain-structured graphs with the Viterbi algorithm
- decode.tree Exact decoding for tree- and forest-structured graphs with max-product belief propagation
- decode.conditional Conditional decoding (takes another decoding method as input)
- decode.cutset Exact decoding for graphs with a small cutset using cutset conditioning
- decode. junction Exact decoding for low-treewidth graphs using junction trees
- decode.sample Approximate decoding using sampling (takes a sampling method as input)
- decode.marginal Approximate decoding using inference (takes an inference method as input)
- decode.lbp Approximate decoding using max-product loopy belief propagation
- decode.trbp Approximate decoding using max-product tree-reweighted belief propagtion
- decode.greedy Approximate decoding with greedy algorithm
- decode.icm Approximate decoding with the iterated conditional modes algorithm
- · decode.block Approximate decoding with the block iterated conditional modes algorithm
- decode.ilp Exact decoding with an integer linear programming formulation and approximate using LP relaxation

Inference: Computing the partition function and marginal probabilities

- infer.exact Exact inference for small graphs with brute-force counting
- infer.chain Exact inference for chain-structured graphs with the forward-backward algorithm
- infer.tree Exact inference for tree- and forest-structured graphs with sum-product belief propagation
- infer.conditional Conditional inference (takes another inference method as input)
- infer.cutset Exact inference for graphs with a small cutset using cutset conditioning
- infer. junction Exact decoding for low-treewidth graphs using junction trees
- infer.sample Approximate inference using sampling (takes a sampling method as input)

CRF-package 3

- infer.lbp Approximate inference using sum-product loopy belief propagation
- infer.trbp Approximate inference using sum-product tree-reweighted belief propagation

Sampling: Generating samples from the distribution

- sample.exact Exact sampling for small graphs with brute-force inverse cumulative distribution
- sample.chain Exact sampling for chain-structured graphs with the forward-filter backward-sample algorithm
- sample.tree Exact sampling for tree- and forest-structured graphs with sum-product belief propagation and backward-sampling
- sample.conditional Conditional sampling (takes another sampling method as input)
- sample.cutset Exact sampling for graphs with a small cutset using cutset conditioning
- sample. junction Exact sampling for low-treewidth graphs using junction trees
- sample.gibbs Approximate sampling using a single-site Gibbs sampler

Training: Given data, computing the most likely estimates of the parameters

4 clamp.crf

| | clamp.crf | Make clamped CRF data structure | |
|--|-----------|---------------------------------|--|
|--|-----------|---------------------------------|--|

Description

Generate clamped CRF data structure by fixing the states of some nodes

Usage

```
clamp.crf(crf, clamped)
```

Arguments

crf The CRF data structure generated by make.crf

clamped The vector of fixed states of nodes

Details

The function will generate a clamped CRF data structure from a given CRF data structure by fixing the states of some nodes. The vector clamped contains the desired state for each node while zero means the state is not fixed. The node and edge potentials are updated to the conditional potentials based on the clamped vector.

Value

The function will return a CRF data structure with additional components:

| original | The original CRF data. |
|----------|--|
| clamped | The vector of fixed states of nodes. |
| node.id | The vector of the original node ids for nodes in the new CRF data. |
| node.map | The vector of the new node ids for nodes in the original CRF data. |
| edge.id | The vector of the original edge ids for edges in the new CRF data. |
| edge.map | The vector of the new edge ids for edges in the original CRF data. |

decode 5

decode

Decoding methods

Description

Computing the most likely configuration

Usage

```
decode.exact(crf)
decode.chain(crf)
decode.tree(crf)
decode.conditional(crf, clamped, decode.method, ...)
decode.cutset(crf, cutset, engine = "default",
              start = apply(crf$node.pot, 1, which.max))
decode.junction(crf)
decode.sample(crf, sample.method, ...)
decode.marginal(crf, infer.method, ...)
decode.lbp(crf, max.iter = 10000, cutoff = 1e-4, verbose = 0)
decode.trbp(crf, max.iter = 10000, cutoff = 1e-4, verbose = 0)
decode.greedy(crf, restart = 0, start = apply(crf$node.pot, 1, which.max))
decode.icm(crf, restart = 0, start = apply(crf$node.pot, 1, which.max))
decode.block(crf, blocks, decode.method = decode.tree, restart = 0,
             start = apply(crf$node.pot, 1, which.max), ...)
decode.ilp(crf, lp.rounding = FALSE)
```

Arguments

```
crf
clamped
cutset
decode.method
infer.method
sample.method
engine
start
max.iter
cutoff
verbose
restart
blocks
lp.rounding
```

6 decode

Details

- decode.exact Exact decoding for small graphs with brute-force search
- decode.chain Exact decoding for chain-structured graphs with the Viterbi algorithm
- decode.tree Exact decoding for tree- and forest-structured graphs with max-product belief propagation
- decode.conditional Conditional decoding (takes another decoding method as input)
- decode.cutset Exact decoding for graphs with a small cutset using cutset conditioning
- decode. junction Exact decoding for low-treewidth graphs using junction trees
- decode.sample Approximate decoding using sampling (takes a sampling method as input)
- decode.marginal Approximate decoding using inference (takes an inference method as input)
- decode. 1bp Approximate decoding using max-product loopy belief propagation
- decode.trbp Approximate decoding using max-product tree-reweighted belief propagtion
- decode.greedy Approximate decoding with greedy algorithm
- decode.icm Approximate decoding with the iterated conditional modes algorithm
- · decode.block Approximate decoding with the block iterated conditional modes algorithm
- decode.ilp Exact decoding with an integer linear programming formulation and approximate using LP relaxation

i <- infer.conditional(small.crf, c(0,1,0,0), infer.exact)
i <- infer.cutset(small.crf, c(2))
i <- infer.junction(small.crf)
i <- infer.sample(small.crf, sample.exact, 10000)
i <- infer.lbp(small.crf)
i <- infer.trbp(small.crf)</pre>
```

make.crf

Make CRF data structure

Description

Generate CRF data structure from the adjacent matrix

Usage

```
make.crf(adj.matrix, nstates)
```

Arguments

 $\verb"adj.matrix" The adjacent matrix of CRF network"$

nstates The state numbers of nodes

Details

The function will generate a empty CRF data structure from a given adjacent matrix. If the length of nstates is less than n.nodes, it will be used repeatly. All node and edge potentials are initilized as 1.

Value

The function will return a CRF data structure, which is a list with components:

| n.nodes | The number of nodes. |
|-----------|---|
| n.edges | The number of edges. |
| n.states | The number of states for each node. It is a vector of length n.nodes. |
| max.state | The maximum number of states. It is equal to max(n.states). |
| edges | The node pair of each edge. It is a matrix with 2 columns and n.edges rows. Each row denotes one edge. The node with smaller id is put in the first column. |
| n.adi | The number of adjacent nodes for each node. It is a vector of length n. nodes. |

sample 9

| adj.nodes | The list of adjacent nodes for each node. It is a list of length n. nodes and the i-th element is a vector of length n. adj[i]. |
|-----------|--|
| adj.edges | The list of adjacent edges for each node. It is similar to adj.nodes while contains the edge ids instead of node ids. |
| node.pot | The node potentials. It is a matrix with dimmension (n.nodes, max.state). Each row node.pot[i,] denotes the node potentials of the i-th node. |
| edge.pot | The edge potentials. It is a list of n.edges matrixes. Each matrix edge.pot[[i]], with dimension (n.states[edges[i,1]], n.states[edges[i,2]]), denotes the edge potentials of the i-th edge. |

```

Examples

```
library(CRF)
nNodes <- 4
nStates <- 2
adj <- matrix(0, nrow=nNodes, ncol=nNodes)</pre>
for (i in 1:(nNodes-1))
adj[i,i+1] <- 1
adj[i+1,i] <- 1
crf <- make.crf(adj, nStates)</pre>
crf$node.pot[1,] <- c(1, 3)</pre>
crf$node.pot[2,] <- c(9, 1)
crf$node.pot[3,] \leftarrow c(1, 3)
crf$node.pot[4,] <- c(9, 1)
for (i in 1:crf$n.edges)
{
   crf$edge.pot[[i]][1,] <- c(2, 1)
   crf$edge.pot[[i]][2,] <- c(1, 2)
```

sample

Sampling methods

Description

Generating samples from the distribution

10 sample

Usage

Arguments

```
crf
size
clamped
cutset
sample.method
engine
burn.in
start
```

Details

- sample.exact Exact sampling for small graphs with brute-force inverse cumulative distribution
- sample.chain Exact sampling for chain-structured graphs with the forward-filter backward-sample algorithm
- sample.tree Exact sampling for tree- and forest-structured graphs with sum-product belief propagation and backward-sampling
- sample.conditional Conditional sampling (takes another sampling method as input)
- sample.cutset Exact sampling for graphs with a small cutset using cutset conditioning
- sample. junction Exact sampling for low-treewidth graphs using junction trees
- sample.gibbs Approximate sampling using a single-site Gibbs sampler

```

sub.crf 11

| sub.crf Make sub CRF data structure |
|-------------------------------------|
|-------------------------------------|

Description

Generate sub CRF data structure by selecting some nodes

Usage

```
sub.crf(crf, subset)
```

Arguments

crf The CRF data structure generated by make.crf

subset The vector of selected node ids

Details

The function will generate a CRF data structure from a given CRF data structure by selecting some nodes. The vector subset contains the node ids selected to generate the new CRF data. Unlike clamp.crf, the potentials of remaining nodes and edges are untouched.

Value

The function will return a CRF data structure with additional components:

| original | The original CRF data. |
|----------|--|
| node.id | The vector of the original node ids for nodes in the new CRF data. |
| node.map | The vector of the new node ids for nodes in the original CRF data. |
| edge.id | The vector of the original edge ids for edges in the new CRF data. |
| edge.map | The vector of the new edge ids for edges in the original CRF data. |
